Making the most of 20 million trees: embedding a provenance trial

Paul Rymer, Corey O’Brien, Courtney Sullivan, Evan Freame

“The Australian Government is working with the community to plant 20 million trees by 2020, to re-establish green corridors and urban forests” 1. There is a need to do more than planting trees with mixed success and limited national benefit. An opportunity exists to direct these resources towards ecological restoration experiments2.

Greening Australia planned a large scale 20 Million Trees project within Western Sydney Parklands to restore natural vegetation cover and habitat connectivity. In partnership with Western Sydney University an experimental planting was established to test ‘local’ seed against seed collected from outside the Cumberland Plain (non-local).

The experimental planting was within Western Sydney Parklands, West Hoxton (NSW) on the Cumberland Plain (top panel). The area consisted of five semi-contiguous plots (1.2 to 7.5 ha) covering a total 17.6 ha (shaded area in middle panel). Site preparation included slashing and two herbicide treatments (broad spectrum + residual herbicide). Two border trees were established around the plot (red line perimeter 3.6 km). Trees were planted 12 m apart with shrubs every metre along rows with 6 m spacing (bottom right panel). Tube stock was established in 10 cm auger holes with slow release fertiliser and water crystals (bottom left panel). Plants were watered monthly for 3 months and finally with fertiliser. A broad leaf selective herbicide was used to control annual weed emergence.

- Experimental planting embedded within 20 Million Tree Program
- Testing ‘local is best’ for dominant eucalypts in the Cumberland Plain Woodland
- Local seed had marginally greater survival
- Experimental design compromised by limited seed
- Additional expertise and labour required
- Potential to build a co-ordinated, nationally distributed network PERRI²

Additional tasks and labour required to setup the experimental planting:

1. LABELLING (8 hours labour)
   - 11 Seedlots X 3-8 trays of 40 plants = 3000 plants with individual pull-through seedlot labels.
2. RANDOMISED LAYOUT (16 hours labour)
   - 50 experimental trays each containing all 11 seedlots with 2-4 seedlings / tray fully randomised.
3. MARKING ROWS (8 hours labour)
   - Marker paint on-ground to indicate border trees, shrubs, and experimental trees for planting team.
4. MAPPING (24 hours labour)
   - GPS the location of all 2000 experimental trees across the 5 plots.
5. MONITORING (30 hours labour)
   - All trees and shrubs in one plot (3825 plants) had health scored (5 point scale) and presence of rabbit grazing and drought dieback recorded.

Acknowledgements
We would like to thank David Kirklend for providing the space and support for the experimental planting in Western Sydney Parklands. Seed was sourced from a number of providers including Greening Australia, the Australian Tree Seed Centre and the NSW Seedbank. Thanks to Robert Peprah and Chris Long for providing additional space in the Greening Australia nursery for labelling and randomising plants into experimental trays. This work was supported by a NSW Environmental Trust research grant 2016/RD/0179 and the 20 Million Trees Program – Service Provider Tranche 3 to Greening Australia.
